# Data Collection and Processing

July 22, 2021

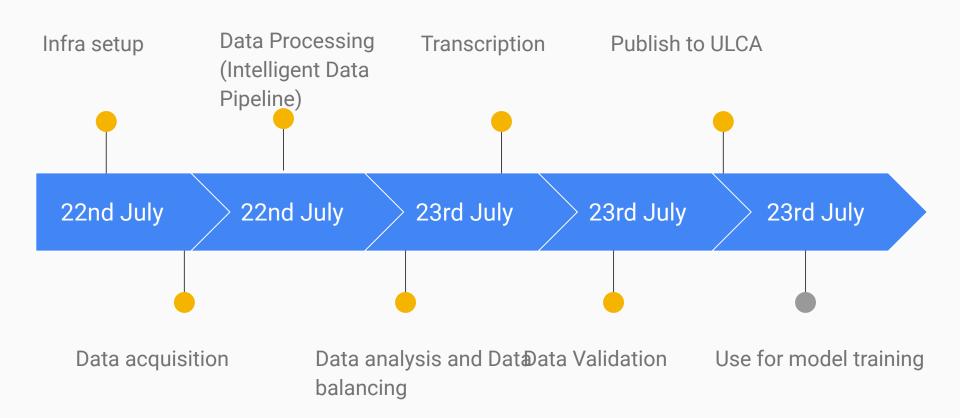

## Model building steps

- Data collection
- Data cleaning and processing
- Model pretraining unsupervised using huge data. (~10K hours)
- Model fine tuning with less data (~500 hours)

## Data collection and processing

- Audio data is in abundance, but it needs systematic and automated approach to collect data
- Data collection and processing needs to be operationalized
- Volume for of data is huge

- Audio is not readable to humans
- Raw audio is not useful for training

# Data Acquisition

- Collect data from multiple sources like youtube, web pages
- Crawl or download specific videos/audios
- Metadata

**Documentation** 

<u>Git repo</u>

## Scrapy

- Framework for scraping and downloading
- Run on infrastructure appropriate for crawling and scraping.
- Run for specific channels, videos
- Or Crawl web using Google search or Bing based on language and keywords

Framework: Scrapy

Infra: Zyte

# Intelligent Data Pipeline

- Convert multiple formats to wav format
- Down sample to sampling rate 16K
- Break into smaller utterances using
   Voice Activity Detection
- Calculate duration of utterances
- Calculate Signal to Noise Ratio
- Build Catalogue

<u>Documentation</u>

Git repo

## Voice Activity Detection (VAD)

#### The typical design of a VAD algorithm is as follows:

- 1. There may first be a noise reduction stage, e.g. via spectral subtraction.
- 2. Then some features or quantities are calculated from a section of the input signal.
- A classification rule is applied to classify the section as speech or non-speech – often this classification rule finds when a value exceeds a certain threshold.

#### <u>VAD</u>

### Python Utility for VAD

The biggest difficulty in the detection of speech in this environment is the very low signal-to-noise ratios (SNRs) that are encountered. It may be impossible to distinguish between speech and noise using simple level detection techniques when parts of the speech utterance are buried below the noise.

### SNR

Signal-to-noise ratio (SNR) is the measurement used to describe how much desired sound is present in an audio recording, as opposed to unwanted sound (noise).

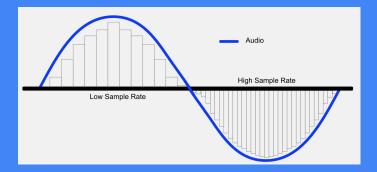

Method used: WADASNR

## Sampling Rate

- Since computers "think" in discrete steps, in order to convert analog audio signals to the digital domain, it's necessary to describe the continuous analog waveform mathematically as a succession of discrete amplitude values.
- In an analog-to-digital converter, this is accomplished by capturing, at a fixed rate, a rapid series of short "snapshots"—samples
  —of a specified size. Each audio sample contains data that provides the information necessary to accurately reproduce the original analog waveform.

- Audio
  High Sample Rate
  Low Sample Rate
- The sampling rate refers to the number of samples of audio recorded every second. It is measured in samples per second or Hertz (abbreviated as Hz or kHz, with one kHz being 1000 Hz).
- The sampling rate is analogous to the frame rate or FPS (frames per second) measurement for videos.
- For model training 16 kHz is used and we downsample all audio to 16 Khz since human voice pitch is contained within 8 KHz frequency.

## Sampling Rate

```
Using Sox
```

#### For Linux:

>> sudo apt-get install -y sox

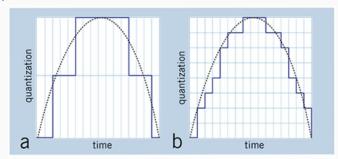

#### For Mac:

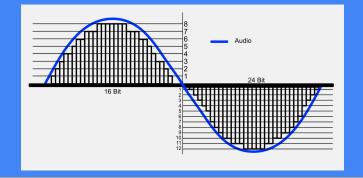

>> brew install sox

>> soxi -r some\_audio.file -n stats

## Sample Depth

- Measured in bits per sample, the sample depth, represents the level of detail, or "quality" each sample has.
- For an audio sample, it simply means that the audio sample can represent a higher range of amplitudes.
- A sample depth of 8 bits means that we have 2<sup>8</sup> = 256 distinct amplitudes and so on for higher sample depths.

- This is analogous to the 8bit or 16bit numbers we might hear about regarding image quality.
- A higher bit depth in a pixel yields a pixel
  that is more color-accurate, since the pixel
  has more bits to "describe" the color to be
  represented on a screen, and the pixel or
  image overall would look more realistic to
  how one would see it in real life.
- More technically, the bit depth of a pixel indicates how many distinct colors can be represented in the pixel.

### Bit Rate

 Tying the sampling rate and the sample depth together is the bit rate, which is simply the product of both.

 Since the sampling rate is measured in samples per second and the sample depth is measured in bits per sample, it is therefore measured in (samples per second) x (bits per sample) = bits per second, abbreviated as bps or kbps. Bit rate = (bits / sample) x (samples / second)

Bit rate = bits / second

# Hands on

# Infra Setup

- Infrastructure as code using Terraform
- <u>Documentation</u>

## Infra Setup

### **Pre requisites:**

- Install <u>terraform</u> (https://learn.hashicorp.com/tutorials/terraform/install-cli)
- Install <u>cloud sql proxy</u>
   (https://cloud.google.com/sql/docs/mysql/connect-admin-proxy#linux-64-bit)
- Install <u>gcloud</u>
   (https://cloud.google.com/sdk/docs/install)
- Install <u>kubectl</u> (https://kubernetes.io/docs/tasks/tools/)
- Install K9s [optional] (https://k9scli.io/)
- GCP Account

### Components

- Composer
- Database
- Buckets
- Service accounts

## Configuration for data pipelines

#### Data collection config:

```
channel_url_dict = {
"https://www.youtube.com/channel/UC_MJkF5uaauVVOH
UVgK5VUQ": "KANNADA_AUDIOS_TEST"
}
```

#### Data processing config:

```
"snrcatalogue": {

"KANNADA_AUDIOS_TEST": {

"count": 5,

"format": "mp4",

"language": "kannada"

}
```
